# **Programming Assignment 3**

Click this link to download the Winery Classification notebook and then complete problem 1-5.

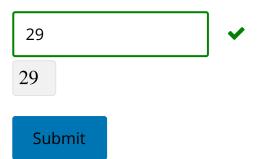

Click this link to download the Gaussian Generative-MNIST notebook and then complete problems 6-8.

### Problem 1

1/1 point (graded)

This problem is based on the Winery classification notebook. You should work through that notebook and then enter answers here.

How many errors (out of 48) are made on the test set when using the single feature 'Ash'?

## Problem 2

1/1 point (graded)

How many errors when using 'Alcohol' and 'Ash'?

12
12
Submit
Problem 3
1/1 point (graded) How many errors when using 'Alcohol', 'Ash', and 'Flavanoids'?
3
Submit
Problem 4
1/1 point (graded) How many errors when using all the features?
2
2
Submit

# Problem 5

1/1 point (graded)

In lecture, we got zero errors on the test set when using all the features. Why might this be?

<ul> <li>In the example from lecture, a different split of the data (into training set and test set) was used.</li> <li>In the example from lecture, a different procedure was used for fitting a Gaussian generative model.</li> <li>✓</li> <li>Submit</li> <li>Problem 6</li> <li>1/1 point (graded)</li> <li>This problem is based on the Gaussian generative MNIST notebook. You should complete that notebook and then enter answers here.</li> <li>What happens if you do not regularize the covariance matrix? Select all that apply.</li> <li>The displayed mean vectors are different.</li> <li>The procedure fit_generative_model generates an error message.</li> <li>The procedure for computing the test error generates an error message.</li> <li>Submit</li> </ul>	<ul> <li>In the example from lecture, the Gaussians were fit to the entire data (both training and test).</li> </ul>
generative model.  Submit  Problem 6  1/1 point (graded) This problem is based on the Gaussian generative MNIST notebook. You should complete that notebook and then enter answers here.  What happens if you do not regularize the covariance matrix? Select all that apply.  The displayed mean vectors are different.  The procedure fit_generative_model generates an error message.  The procedure for computing the test error generates an error message.	
Problem 6  1/1 point (graded) This problem is based on the Gaussian generative MNIST notebook. You should complete that notebook and then enter answers here.  What happens if you do not regularize the covariance matrix? Select all that apply.  The displayed mean vectors are different.  The procedure fit_generative_model generates an error message.  The procedure for computing the test error generates an error message.

This problem is based on the <i>Gaussian generative MNIST notebook</i> . You should complete that notebook and then enter answers here.  What happens if you do not regularize the covariance matrix? Select all that apply.  The displayed mean vectors are different.  The procedure fit_generative_model generates an error message.  The procedure for computing the test error generates an error message.	Problem 6
<ul> <li>The displayed mean vectors are different.</li> <li>The procedure fit_generative_model generates an error message.</li> <li>The procedure for computing the test error generates an error message.</li> </ul>	This problem is based on the <i>Gaussian generative MNIST notebook</i> . You should complete
<ul> <li>The procedure fit_generative_model generates an error message.</li> <li>The procedure for computing the test error generates an error message.</li> </ul>	What happens if you do not regularize the covariance matrix? Select all that apply.
<ul> <li>The procedure for computing the test error generates an error message.</li> </ul>	The displayed mean vectors are different.
✓	The procedure fit_generative_model generates an error message.
Submit	The procedure for computing the test error generates an error message.
Submit	✓

	Subtriic

# Problem 7

1/1 point (graded)

What happens if <code>j</code>	you set the \	value of $\emph{c}$ too	high, for	instance to	one billion?	Select all t	that
apply.							

○ The pro	cedure fit_generative_model generates an error message.	
○ The pro	cedure for computing the test error generates an error message.	
O The test	error approaches that of a random classifier.	
<b>~</b>		
Submit		
roblem 8		

1/1 point (graded)

What value of  $\emph{c}$  did you end up using? \*Note: any value of  $\emph{c}$  will be accepted.

1000 1000

#### **Answer**

Correct: Our value of c=4000 yields an error of ~4.3%
